The latest analysis and report:

https://bit.ly/CEZ_1Q22preview_EN
https://bit.ly/CEZ_1Q22_review_EN

Investment case: We reiterate Buy recommendations for CEZ with a new target price of CZK1,393 (both the recommendation and target price were under revision).

Inflation in energy commodities, especially gas, translates into a substantial increase in electricity prices, which has a significantly positive impact on CEZ's performance. The impact will be mostly reflected in the next two years, when we project high EBITDA growth. The share of nuclear power plants in the generation segment will be around 60%. Their low emissions intensity production with low fixed costs will thus directly benefit from high electricity prices. Moreover, they generate the highest margins and thus we expect they will be used at full capacity. In addition to the suspension of coal-fired generation, CEZ will reduce its emissions intensity, which is key for CEZ's "green" vision. The advantage is further extended considering the high prices of emissions allowances, leading to higher profitability of the company's generation portfolio. Investments in the coming years might be directed toward distribution, renewables or the ESCO sector.

CEZ has updated its dividend policy and will not pay out 60-80% of adjusted net profit (previously 80-100%). This year, shareholders are expected to approve a dividend of CZK44 per share. The payout will still include a share from the sale of Bulgarian assets (CZK7). No further extraordinary payouts are expected. Nevertheless, given the expected strong earnings growth, the dividend will jump to CZK74 next year and up to CZK153 in the coming years, easily surpassing historic payouts. The gross dividend yield on the current price could potentially swing above 10%.

Valuation: Using the discounted cash flow model we set our new target price at CZK1,393, signifying a substantial 18.2% upside potential. Current market valuation reflects 14.9x P/E and 9.3x EV/EBITDA which provide mixed evidence for valuation compared to the Western European counterparts from the utility sector (14.2x P/E, 8.2x EV/EBITDA) and the whole Europe (10.8x P/E, 7.8x EV/EBITDA). The top-line growth in our projections, especially from 2023 onwards, lowers forward multiples thus, indicating significant discount. CEZ's 3.8% gross dividend yield is currently below competition's median of 5.1%, respectively 4.6%.

Major risks: One of the main factors is the availability of production facilities, especially nuclear, which carry the highest margins. Adverse development on the commodity markets might significantly affect the business, mainly the decline in electricity prices. Therefore, higher prices would further significantly foster the company's business in the coming years.

Sector trends

Electricity prices

Power prices continue to hold at very high levels. Toward the end of last year, prices began to fall from their highs of EUR320 per MWh to EUR120 per MWh at the start of this year. Currently prices hover around EUR230 per MWh, representing an almost 100% growth year-to-date. For comparison, the average electricity price in 2019 and 2020 was EUR44 per MWh. The exorbitant growth began in the second half of 2021, the main reason being the dramatic rise in the energy commodity prices, namely gas, coal, and emissions allowances, in particular gas, which has contributed the most to the present increase in electricity prices, as illustrated by the graph below.

For the coming years, futures contracts suggest that the price will fall from the current EUR230 per MWh to around EUR140 per MWh.

Gas

Record gas prices due to supply uncertainty.

Emissions allowed at all-time highs.

The current electricity prices currently find themselves primarily grappled by natural gas, respectively its market price. Exorbitant prices stemming from geopolitical tensions and the uncertainty of Russian gas supply have a significant influence on the whole energy market. While the global gas supply is plentiful, Russia constitutes Europe's most important supplier with a 45% share. Therefore, large uncertainty lingers regarding further supplies, restrictions or sanctions which translates into high natural gas prices. Current prices hover between EUR100 and EUR80 per MWh, after crossing EUR200 per MWh earlier this year. Average prices for 2019 and 2020 were around EUR12; moreover, in the first half of 2021 the price was still "just" EUR20. The following steep growth was stimulated by a longer winter, empty gas storage facilities and above all, large supply uncertainty.

CO₂ emissions allowances

The current price of CO₂ allowance above EUR85 per tonne is now just below the historic high of around EUR100 per tonne from earlier this year. Trading has been very volatile recently. Coinciding with the rise of natural gas prices in the middle of last year, price of CO₂ allowances also rose. The average for 2019 and 2020 was EUR25. The main factors behind the steep growth are obviously the climate policy and gas prices, which are forcing operators to replace the generation from the commodity for other mainly coal-fired sources. The latter is more emissions-intensive (producing twice as much CO₂) and thus drive up demand for emissions allowances.

Coal

With coal it is a similar story of a substantial price increase in the second half of last year and high volatility. Average coal prices between 2019-2020 were about USD65 per tonne. Currently they are around USD250 per tonne, about 170% growth YTD, only slightly below the record of USD270 reached in March this year. The key driver is likely high demand as operators substitute gas-fired generation for coal. We assume these operational coal-fired plants will remain in service despite the plans to shut them down.

Power prices (€/MWh), CO₂ (€/MWh), coal (\$/t) and gas (€/MWh)

Source: Bloomberg

CEZ's share price lags behind the power price.

The chart below shows the CEZ share price is more or less correlated with the development of power electricity prices. Although, we have seen a diversion lately as the CEZ share price (+35% YTD) could not cope with skyrocketing electricity prices, which have risen by almost 100% YTD.

Development of CEZ's shares vs. German electricity prices

Company results

The year 2020

Significant growth, guidance increased again.

CEZ's results for the first quarter increased substantially year-on-year. The company's management has once again raised its 2022 guidance.

EBITDA grew 119% yoy to CZK43.7bn, with sales growing 28.6% yoy to CZK76bn this year. Net profit adjusted for extraordinary items reached CZK26.7bn, up 219% yoy. The increase was driven by the rise in electricity prices and trading profit. CEZ revised its EBITDA guidance for this year upward to CZK95-99bn as well as net profit to CZK45-49bn. The update came along with the publication of 1Q22 results on May 10. The previous guidance (announced on March 15) included EBITDA in the range CZK85-89bn and net income between CZK38-42bn. The key driver is realised electricity prices and trading profits. The expected realised electricity price for this year is EUR95-98 per MWh (compared to the previous EUR79).

In our projections, EBITDA this year should reach CZK101.5bn, slightly above the upper limit of CEZ's guidance. Net profit we estimate at CZK50.1bn, with a strong top-line growth as sales are expected to reach CZK293.8bn. The volume of procured electricity should increase only slightly to 56.2TWh from 56TWh last year. Meanwhile, the realised electricity price in our projections is EUR97.3, which is very high compared to last year's EUR50.

1Q22 results

CZK bn	1Q21	1Q22	y/y	KB estimate	consensus
Sales	59.1	76.0	28.6%	74.9	77.1

Politicians are considering restructuring however, that would not solve the current crisis.

Construction of a new nuclear unit

It has been reported in recent weeks that politicians are considering the possible restructuring of CEZ. The discussions are, however, at a very early stage. This would potentially mean a breakup of CEZ into parts. The production side of the business would be fully controlled by the state, meaning it would have to buy out minority shareholders. In such a case, we would expect a hefty premium in tens of percent. The main motivation behind this proposal is the solution to the energy crisis caused by high electricity prices. However, from our point of view, we do not see how it would solve the current situation. The process of splitting up and squeezing out minority shareholders would certainly take several months or years, while the government needs to resolve the issue at hand as soon as possible. An alternative could be approving a higher dividend using the state's 70% stake at the upcoming general assembly meeting scheduled for 28 June.

Split-up would allow the government to decide regarding the construction of new nuclear blocks.

Restructuring, respectively dissection of the business, would give the government relative freedom regarding the construction of new nuclear units, regardless of minority shareholders. The tender offer period has begun, and initial bids are expected by the end of November 2022 with final bids to come in late 2023. The process is expected to be finalised at the end of 2024. Current bidders include French EdF, Canadian Westinghouse and Korean KHNP. CEZ's new nuclear units would be 100% financed by the state.

Long-term forecasts

Nuclear power plants play the main role.

Unsurprisingly, the decisive share of the current generation business will be accounted for by the existing nuclear power plants for the explicit period. Production should reach up to 32.1 TWh in 2026 from this year's expected 30.8 TWh. Expansion of the current nuclear power plant portfolio cannot be expected in the forecasted period. Coal-fired generation is expected to decline. The installed capacity of coal-fired power plants will accordingly decrease from 4.3 GW in 2021 to 2.2 GW in 2030. Only the modernised plants in Prunerov, Tushumice and Ledvice should remain operational. CEZ's goal is complete diversion from coal-burning power plants in 2038. CEZ has a single gas-fired power plant in Pocerady, the installed capacity of which is expected to remain unchanged around 1 GW. Generation from renewable resources should increase along with the growth of their installed capacity. The current planning involves adding 1.5GW of renewable capacity by 2025 and 6 HW by 2030 thus, increasing the installed capacity from last year's 2.2 GW to 3.7 GW in 2025.

Realised prices will increase

The sharp rise in electricity prices will have a positive effect on company's numbers.

Electricity price has been steadily rising since the beginning of this year, as shown by the chart on page 4. The main reason being the rising prices of energy commodities, especially natural gas. The current market price is around EUR240 after trading around EUR120 at the start of the year. The futures contracts show that future prices are gradually falling from EUR240 for 2023 to EUR150 in 2026.

According to our projections, CEZ sold this year's electricity production at an average price of EUR97.3 per MWh. For the next year, we expect an almost 50% increase to EUR145 per MWh. We estimate the selling price of the assured electricity supply (base load) in the following years at about EUR130-140 per MWh. The overall selling price will, however, be higher due to the inclusion of peak load prices. Therefore, the final calculated price nears EUR145. See the hedged prices, our estimated prices and forward market prices on the righthand graph below.

Hedged sales and average prices (EUR/MWh)

Source: CEZ, Economic & Strategy Research, Komerční banka

Expected higher realised prices (EUR/MWh)

Source: CEZ, Bloomberg

EBITDA is headed above CZK100bn.

CEZ's earnings projections

We expect sales to grow at a compound annual average rate of 8.7% over the 2022-2026 period. From CZK228bn in 2021, it should reach CZK346bn in 2026. Most substantial growth will occur between 2022 and 2023 primarily due to peaking realised electricity prices, when they will reach up to CZK145.

We estimate large EBITDA growth from CZK63.2bn in 2021 to this year's CZK101.5bn, growing 15.3% on average. The highest figures are expected to be achieved in 2023 and 2024 as EBITDA will near CZK150bn. In the last year of our forecast, we expect EBITDA to reach CZK129bn. Management's projections for this year include EBITDA in the CZK95-99 range.

Similarly, adjusted net income should peak around CZK80bn in 2023 and 2024, then reaching CZK68bn in 2026. For this year, we estimate CZK50.1bn while CEZ's projection reads CZK45-49bn. This is a reminder that adjusted net income serves as the basis for the calculation of dividends. Therefore, an excellent performance in the following years should translate into more generous payouts; see below.

CEZ results forecasts (CZKbn)

Source: CEZ, Economic & Strategy Research, Komerční banka

Dividend policy

Dividend for the next year will be CZK74, representing 6.4% gross dividend yield.

At the beginning of the year, **CEZ updated its dividend payout from 80-100% of adjusted net income to the current 60-80%. The planned dividend due from last year's earnings is CZK44.** The payout composes of the standard dividend (CZK37), constituting a 90% payout ratio and extraordinary dividend (CZK7) due from the sale of Bulgarian assets. Shareholders will approve the dividend **at the general assembly meeting on 28 June.** Using its 70% majority stake, the Finance Ministry could potentially propose and approve a higher dividend. Nonetheless, the government usually follows the management's recommendation.

Expected dividend payment per share (CZK)

Source: CEZ, Economic & Strategy Research, Komerční banka

Further, we see a potential return to higher payout ratios.

Dividends containing an extraordinary payout in addition to the standard part delighted investors last year and will continue to do so this year. While the extraordinary payouts cannot be further expected, dividends in the coming years will be fostered by extremely good figures, resulting in generous payouts. We project **next year's dividend at CZK74, constituting an 80% payout ratio** and 6.4% gross dividend yield. CEZ's guidance is in the range of CZK67-73.

In light of the strong performance in our projections, we do not expect the conservative dividend policy of 60-80% payout to last long. We assume that **the company will return to more generous payout ratios in the future. From 2024 onward, we project dividends up to CZK153**, primarily fostered by good results and strong cash flow.

Indebtedness

Leverage is significantly below CEZ's projections (2.5x for 2025 and 3.0x for 2030)

CEZ projects leverage (Net Debt /EBITDA) at 2.5x in 2025 and further 3.0x in 2030, including projected annual Capex at around CZK48bn for the period of 2021-25 and a range of CZK50-55bn in 2026-30. Published figures for **1Q22 show leverage at an already low 0.9x**, primarily given by the large EBITDA increase.

Leverage will drop to 0.7x.

In the coming years, almost CZK50bn of debt matures, including the EUR269m bond still due this year. In the next two years (2023 and 2024), there are no substantial maturities whereas considerable amounts are due in 2025 and 2026 (see below). **Considering the strong EBITDA growth in our projections, we expect leverage to drop to 0.7x.** In line with our assumption of falling leverage, we expect debt service expenses to decrease from last year's CZK4.2bn to approx. CZK3.5bn this year. Furthermore, we **project debt service around CZK3.8-3.9bn.**

On account of rising interest rates and further upside pressure, additional debt emissions and consequently higher leverage would pose a heightened risk to the company's financials. Nevertheless, considering the **current low levels of indebtedness and projected strong bottom-line growth additional debt service burden ought to be comfortably covered.**

Maturity profile of the issued bonds (CZKbn)

Valuation

Sector comparison

Relative comparison is mixed.

We have selected competitors operating in both Western and Central Europe. CEZ's valuation corresponds more to its Western European counterparts, as shown by the table below. Current P/E and EV/EBITDA multiples indicate a premium compared to its peers. Considering the strong growth in our projections, forward multiples for 2023 indicate a significant discount. CEZ currently offers an below-median gross dividend yield compared to its Western European counterparts and the whole Europe (3.8% vs 5.1%, respectively 4.6%).

Target price

Using the DCF model, we establish a new target price at CZK1,393.

Using a two-stage discounted cash flow model with a five-year explicit forecasting period, we determine the fair value of the company. Key parameters and outputs of the model can be found in the table below. Free cash flow is discounted using a weighted average cost of capital (WACC) in the range of 6.8-7.5% for the explicit period. The horizon value is calculated using a terminal rate of WACC, which reflects normalised values of risk-free interest rates and equity risk premia. The terminal growth rate is assumed at 2%. Based on the DCF model **we obtain and set our new target price at CZK1,393**, the key driver being the positive impact of growing electricity prices on the company's profitability and cash flow creation.

The following table provides a snapshot of the sensitivity of CEZ's target price to changes in key parameters of the valuation, namely forward electricity prices, WACC and the long-term growth rate.

Sensitivity analysis

WACC						WACC							
Long-term growth		-100bps	-50bps	7.2 % / 7.3 % *	+50bps	+100bps	Forward prices		-100bps	-50bps	7.2 % / 7.3 % *	+50bps	+100bps
	1.0%	1,396	1,276	1,176	1,090	1,017		-20%	1,151	1,031	933	852	784
	1.5%	1,541	1,396	1,276	1,176	1,090		-10%	1,425	1,280	1,163	1,066	984
	2.0%	1,715	1,537	1,393	1,274	1,174		0%	1,699	1,530	1,393	1,280	1,185
	2.5%	1,945	1,719	1,541	1,396	1,276		10%	1,973	1,780	1,624	1,494	1,386
	3.0%	2,239	1,945	1,719	1,541	1,396		20%	2,247	2,030	1,854	1,708	1,586

Note: * the first value corresponds to the average for the years 2022-26, the second value after 2026; Source: Economic & Strategy Research, Komerční banka

Major risks

- **Electricity prices** - CEZ share prices are significantly affected by the development of electricity prices on European markets. A significant deviation of German electricity prices from our forecasts may cause a different development of CEZ's profits than we currently expect.
- **Production mix** - In the coming years, we expect full utilisation of nuclear power plants. This has an impact on the development of profit margins. Should longer nuclear block shutdowns occur, it would lead to lower margins.
- **Renewal of the production portfolio** - CEZ has completed the modernisation of its coal-fired power plants. The highest share of investment should go to distribution, renewables and the closure and transformation of production from coal to low emissions. Any contribution to the construction of a new nuclear unit could have a strong negative impact on our valuation.
- **Regulation** - The energy sector suffers from strict regulation and in some countries also comes under political and public pressure. The potential reduction in support for electricity production from renewable sources is also a major risk.
- **Exchange rate developments** - Although the company is naturally hedged against fluctuations of the EUR/CZK exchange rate, the stronger-than-expected appreciation of CZK against EUR would be negative for CEZ. The impact on electricity prices (Czech prices are derived from German prices in EUR) could outweigh the euro-debt reduction. The weakening of the Turkish lira against USD leads to a decline in profits from affiliates and joint ventures and an increase in financial liabilities due to the loan guarantee provided to the Turkish company AkCEZ.
- **Acquisitions** - Potential acquisitions are not included in our forecasts. Big M&A deals would likely increase CEZ's consolidated profits as well as its debt. The impact on our target price and recommendation might be either positive or negative depending on the parameters of the transaction.
- **Tax reform** - From time to time, politicians appear to increase taxation on big companies. There is no additional tax on energy companies on the table for now. However, the introduction of a sectoral tax would result in lower net profit, which would be reflected in a lower dividend payout.

The recommendation in this document and/or the document itself was not disclosed to the issuer before its dissemination.

This recommendation is not updated at regular intervals. The date of the next update has not yet been determined and finally will be influenced by relevant changes of the facts used as the ground for this recommendation to reflect proper development in the industry and/or the analyzed company.

The main methods KB is using for setting target price for stocks are discounted free cash flow analysis and sector comparison. Other methods may also be used if deemed appropriate by the analyst (e.g. sum of parts valuation, discounted dividend valuation, discount / premium to NAV). Target price is set for the time period of 12 months. KB is using three grades of investment recommendation: buy, hold and sell. The recommendation is set for the time period of the next 3-6 months. The most important factor for setting the recommendation is the difference between actual market price and target price calculated by KB equity research. The recommendation also reflects other factors the analyst expects to influence the stock and market in the time period of 3-6 months after its publication. The target price substantially above current price does not automatically mean a buy recommendation for the 3-6 months following the first period of 3-6 months since publication of the recommendation. Valuation methods and factors key for setting the recommendation are explained in the text of each analysis.

The chart below shows the structure of grades of valid investment recommendations of equity research of KB Economic & Strategy Research (8 recommendations).

Investment recommendations of KB equity research

Source: Economic & Strategy Research, Komerční banka

KB Equity Research ratings on a 12 month period

BUY: absolute total shareholder return forecast of 15% or more over a 12 month period.

HOLD: absolute total shareholder return forecast between 0% and +15% over a 12 month period.

SELL: absolute total shareholder return forecast below 0% over a 12 month period.

Total shareholder return means forecast share price appreciation plus all forecast cash dividend income, including income from special dividends, paid during the 12 month period. Ratings are determined by the ranges described above at the time of the initiation of coverage or a change in rating (subject to limited management discretion). At other times, ratings may fall outside of these ranges because of market price movements and/or other short term volatility or trading patterns. Such interim deviations from specified ranges will be permitted but will become subject to review by research management.
